VERSION DESCRIPTION
v1 : Edited dataset for internal use only.

PRODUCTION DATE
2007-06

Overview

ABSTRACT

Drug abuse has become multi-dimensional problem in Nepal and drug control, a challenge for the government. Lack of reliable information on size and characteristics of drug users was the bottleneck in formulating effective plans/programs and implementation as well. Considering these facts, the Central Bureau of Statistics upon the request of the Ministry of Home Affairs conducted a survey on hard drug users in Nepal in 2006/07.

The main objective of the survey was to estimate the total number of hard drug users in Nepal. The secondary objective was to generate information on the characteristics of drug users, such as: age, sex, education, age at first intake, frequency/duration of drug use, expenses made on drug etc.

KIND OF DATA
Sample survey data [ssd]

UNITS OF ANALYSIS
Individual

Scope

NOTES

Men and Women using hard drugs: Age patterns of drug users, Age at first drug intake, Number of years drug intake, Frequency of drug intake per day, Cost for a single dose, Currently attending school/campuses, Occupational status, Educational status, Marital status, Types of drug ever used, Reasons for drug intake, Sources of drug, Injecting Drug Users (IDUs), Rehabilitation Centre visit, Voice of drug users.

TOPICS

Topic	Vocabulary	URI
social behaviour and attitudes [13.6]	CESSDA	http://www.nesstar.org/rdf/common

Coverage

GEOGRAPHIC COVERAGE
National Coverage

It is assumed that hard drugs are supplied or available mostly in urban areas and so, urban areas and the vicinity are affected most. Also it is assumed that substance users from rural area, who became dependent, live and wander in urban area and vicinity. However, those who live on medical drugs only and live in rural area may have been out of the survey coverage. So, the survey covered 17 municipalities of the five development regions. Among those municipalities, rehabilitation centres were being operated in 12 municipalities. There was no rehabilitation centre found in rest of the 5 municipalities.

GEOGRAPHIC UNIT

National

UNIVERSE

All the drug users under treatment in any of the rehabilitation center are taken into account of this survey. Other 100 current hard drug users from each spot are also taken into account.

Sampling

Sampling Procedure

Usual survey methodology (general household/population survey) is not recommended to estimate the prevalence of hard-to-reach hidden population such as hard drug users, commercial sex workers, homeless people, etc. for some reasons. Sampling frame is not usually available and also very difficult or impossible to construct. Due to the low prevalence rate as compared to the total population, it may require larger sample size and relatively more resources. More importantly, respondents may not be willing to respond because of the sensitivity of the topic itself.

An alternative approach of estimation technique has to be used to get the most reliable picture of the real situation. For this, we have selected the Multiplier Method of indirect estimation technique.

The multiplier method has two elements in common: the benchmark and the multiplier.

The benchmark (B) is the data source that captures the number of hard drug users who are under treatment in the rehabilitation centers in the reference year. The multiplier (M) is an estimate of the proportion of current hard drug users who have experienced the event recorded by the benchmark, i.e. the proportion of such drug users who have been in treatment in the rehabilitation centers in the reference period. This information is obtained independently of the benchmark data. The inverse of that proportion is the multiplier (M), which is an indirect estimate of the proportion of the total population of the hard drug users represented in the benchmark data.

The prevalence is calculated by multiplying the benchmark by the multiplier (B x M). Hence,

$$N = B \times M = B \times (1/p)$$

where,

N is the total number of hard drug users,

p is the proportion of the hard drug users who have visited the rehabilitation centers in the reference period.

Sample size:

In each of the selected area, sample size for the interview with current hard drug users were fixed at 100 respondents. This number is derived with following assumptions:

Estimated proportion of drug users visiting rehabilitation centers = 7%

Margin of error in estimation = 5% and

Level of confidence = 95%

The total achieved sample size was 1319.

Response Rate

100 percent

Weighting

Sample weights were calculated for each of study area. The weight was calculated as the ratio of drug users captured in the rehabilitation centre in the past year to rehabilitation visit rate i.e. number of drug users taken as numerator and rehabilitation centre visit rate taken as denominator.

In the HDUS 2006/07 dataset, the weighting coefficient is called WEIGHT.

Questionnaires

Overview

The questionnaire for the Hard Drug Users Survey was a structured questionnaire. It includes some demographic characteristics as well as some individual characteristics like sex, age, relationship and other status.

Data Collection

Data Collection Dates

Start	End	Cycle
2005-12-17	2006-12-16	N/A

Data Collection Mode

Face-to-face [f2f]

Data Collection Notes

For the benchmark data, complete listing of all hard drug users under treatment in all rehabilitation centres operated in Nepal within the reference period were collected.

For the multiplier data, current hard drug users were sampled and interviewed from each of the selected spots within the selected areas.

With the help of the outreach workers of the rehabilitation centres, it was possible to reach the current hard drug users in the spot and interviewed.

Date of collection was according to Nepali calendar.

Questionnaires

The questionnaire for the Hard Drug Users Survey was a structured questionnaire. It includes some demographic characteristics as well as some individual characteristics like sex, age, relationship and other status.

Data Collectors

Name	Abbreviation	Affiliation
Central Bureau of Statistics	CBS	National Planning Commission

Supervision

Interview was conducted by a team of interviewers (all were experienced CBS central staff). Supervision has been performed by CBS central officers to control the quality of the fieldwork.

Data Processing

Data Editing

Data editing was done at a various stages throughout the processing. That included office editing and coding, and structural checking of SPSS data files.

Other Processing

Office editing and coding was performed after the questionnaires were received at Central Bureau of Statistics. Data entry was done on SPSS. Structure checking, verification of data and backup of raw data was also completed.

Data Appraisal

Other forms of Data Appraisal

Since response rate was 100 percent and non-sampling errors were managed well, no any other action taken to access reliability of the data.

File Description

Description

Person who intakes opiates and chemical substances like Cocaine, Heroin, LSD, Morphine, Buprenorphine etc. is defined as hard drug users in this survey. Similarly, those who inhale adhesive substances like dendrite and other polishing substances are also considered as hard drug users. Those who consume only marijuana and alcohol are not considered as hard drug users. But, if a person consumes marijuana or alcohol with one of the other hard drugs as mentioned above, then he/she is considered as hard drug user.
